LETTER OF TRANSMITTAL

PENNSYLVANIA DEPARTMENT OF AGRICULTURE
BUREAU OF FOODS AND CHEMISTRY

Harrisburg, May 29, 1930.

Hon. C. G. Jordan,
Secretary of Agriculture,
Harrisburg, Pa.

Dear Sir:

I have the honor to transmit herewith for your approval a report showing the tabulated results of chemical analyses made by this Bureau, in accordance with the requirements of the Fertilizer Law, of the official samples of Commercial Fertilizers obtained by the Special Agents during the Spring and Fall shipping seasons of 1929.

It is recommended that this report be published in bulletin form for distribution.

Very respectfully,
JAMES W. KELLOGG
Director—Chief Chemist

FERTILIZER REPORT

1929

INTRODUCTION

The Fertilizer Law, Act of May 1, 1909, as amended, which regulates the sale of Commercial Fertilizers, requires registration for each calendar year and before being offered for sale; all sacks or attached cards to be printed with net weights, brand or trade names, names of Manufacturers or Importers and guarantees for the minimum percentages of nitrogen, ammonia, total and available phosphoric acid and water soluble potash which they may contain. Commercial Fertilizers are defined as including any and every substance sold for fertilizing or manuring purposes except marl, lime, wood ashes and the dung of domestic animals. Standards are fixed for mixed Fertilizers which require that they shall contain not less than 14 units or 14 per cent. of total plant food: nitrogen equivalent to ammonia, available phosphoric acid and water soluble potash, that all Fertilizers shall contain not less than 1 per cent. of nitrogen as ammonia, 1 per cent. of phosphoric acid and 1 per cent. of water soluble potash. Any Fertilizer having the word "tobacco" as a part of the brand name is prohibited from containing potash as chloride of potash.

A license fee of from \$15 to \$50 is required to be paid for every kind or brand of Fertilizer registered, the rate being \$15 for each new brand, and in the case of brands sold during any preceding year and re-registered the fees are based on the tonnage amounts sold as follows: Sales up to 150 tons, \$15; 150 to 250 tons, \$20; 250 to 400 tons, \$30; 400 to 500 tons, \$40, and over 500 tons, \$50 for each brand.

The number of tons of Fertilizer sold annually is required to be reported and included with applications for registration, regardless of whether or not any brands sold during a preceding year are re-registered or discontinued, in order that the amount of tonnage sales may be properly recorded and that the amount of fees may be estimated for the brands to be registered. Provision is made for enforcement by authorizing the inspection of methods of sales, the collection and analyses of official samples, the publication of results of analyses for the information of the public and for holding selling agents responsible for failure to meet the requirements with respect to registration, labeling and guaranteeing.

During the Spring and Fall shipping seasons of 1929 Special Agents of the Bureau collected from selling agents throughout the Commonwealth 2,583 official samples, which were submitted for examination, together with reports covering each shipment or lot sampled, showing labeling and sales conditions and the information printed upon sacks or attached cards. Of this number 2,359, representing registered brands, were analyzed for the forms and amounts of plant food which

they were guaranteed to contain. There were 731 different brands registered by 74 Manufacturing and Importing firms, the number of brands, samples and classes represented being as follows:

Ground Bone Fertilizers	37	73

Brands Registered and Tonnage Sales

Fertilizer registrations were received and approved from 126 Manufacturing and Importing firms covering 1,230 different brands and kinds of Fertilizers for which 234 licenses were issued, authorizing sales during 1929. They included 855 brands of Mixed Fertilizers containing 14 per cent. or more total units of plant food and 375 brands of so-called base goods, supplying one or more forms of plant food.

The amount of Fertilizers sold during the preceding year, 1928, as shown by reports accompanying 1929 registrations, totalled 339,984 tons, being in excess of the 326,514 tons reported for 1927 sales. The amounts of the several classes of materials reported as being sold during 1928 were as follows: Complete Fertilizers 231,867 tons, Nitrogen and Phosphoric Acid Fertilizers, 41 tons, Phosphoric Acid and Potash Fertilizers 19,292 tons, Superphosphate Fertilizers 75,802 tons, Ground Bone Fertilizers 3,386 tons, Tankage 2,111 tons, Nitrate of Soda, 3,578 tons, Potash Salts 1,883 tons, Sulphate of Ammonia 833 tons, Dried Blood 11 tons and Miscellaneous Materials 1,180 tons. The amount of plant food supplied by these Fertilizers estimated on the basis of guarantees shown in registrations was 6,507 tons of nitrogen as ammonia, 36,726 tons of available and total phosphoric acid and 14,565 tons of water soluble potash, making a total of 57,798 tons of the three forms of plant food disposed of during 1928.

Conclusions

Of the total number of official samples analyzed 235, or 10.0 per cent., were found upon analysis to be deficient in one or more forms of plant food to the extent of .2 per cent. or more and in the case of guarantees of .50 per cent. or less to the extent of .1 per cent. or more compared with guarantees. A comparison with the estimated deficiency of 11.5 per cent., reported for 1928, shows that there was an improvement in the correctness of guarantees for plant food in the Fertilizers sold during 1929 and a decided improvement compared with the 18.9 per cent. deficiencies reported for the 1927 inspection. The proportion of deficiencies in each of the separate classes of Fertilizers were as follows: Complete Fertilizers 11.1 per cent., Ground Bone Fertilizers 15.1 per cent., Superphosphate Fertilizers .9 per cent., Lime Phosphate Fertilizers 5.9 per cent., Rock and Potash Fertilizers 16.2 per cent. and Miscellaneous Fertilizers 9.2 per cent. The deficiencies estimated for each form of plant food taken separately and as

supplied by the several classes of materials show that 65, or 3.7 per cent., of the samples guaranteed for nitrogen were deficient, 7, or 8.4 per cent., were deficient in total phosphoric acid, 21, or 1.0 per cent., were deficient in available phosphoric acid and 157, or 8.6 per cent., were deficient in water soluble potash. A comparison of these deficiencies with the similar variations estimated for the 1928 inspection show decreases in the proportion of failures to meet the guarantees in the case of total and available phosphoric acid as well as in the proportion of Complete Fertilizers which failed to come up to the claims made for guaranteed amounts of plant food.

In the case of brands of Fertilizers registered there was practically no difference in the number of brands included, 1230 being registered for 1929 sales, 2 less than for the preceding year. The tonnage sales reports accompanying registrations showed an increase in that there were 339,984 tons of all classes of Fertilizers sold during 1928 compared with 326,514 tons for 1927 and 328,904 tons for 1926. An estimate of the amount of plant food, based on guarantees, for the Fertilizers disposed of shows that approximately 57,798 tons of nitrogen as ammonia, total and available phosphoric acid and water soluble potash were sold during 1928, being less than the estimate of 80,801 tons for 1927, compared with 55,402 tons of total plant food estimated for 1926 sales.

The results of microscopical examinations of those brands of Fertilizers which might possibly have carried prohibited materials or revealed misbranding failed to show unlawful sales. There were, however, a number of non-registered brands found being disposed of, which made it necessary to hold selling agents responsible for non-compliance with the registration provisions of the law.

Retail Selling Values. The average retail selling values per ton for the several classes of Fertilizers were as follows: Complete Fertilizers \$33.36; Ground Bone Fertilizers \$52.47; Superphosphate Fertilizers \$20.64; Lime Phosphate Fertilizers \$20.10 and Rock and Potash Fertilizers \$26.20. These average retail selling values cannot be considered as an accurate index of the prevailing prices, especially in those cases where only a small number of samples were involved, however, as the number of samples of Mixed Fertilizers were more than half of the total received a comparison of the average retail selling value of \$33.36 a ton with that of \$34.08 a ton, estimated for 1928 Complete Fertilizers, shows an average reduction in these values. The average values for the remaining classes were also slightly less than reported for the preceding year's inspection, as will be noted in Table II. On the basis of these retail values approximate average unit values for the three forms of plant food supplied by the several classes of materials were estimated as follows: Nitrogen \$4.25, available phosphoric acid \$1.12, water soluble potash \$2.13. There was very little difference except in a lowering of the unit value for nitrogen compared with the 1928 values, which were as follows: Nitrogen \$4.79, available phosphoric acid \$1.19 and water soluble potash \$2.11.

Complete Fertilizers. This class of Fertilizers supplying nitrogen as ammonia, available phosphoric acid and water soluble potash in amounts in excess of 14 total units or per cent. included more than

one-half of the total samples and brands submitted for examination, numbering 1,620 samples and 480 brands, registered by 68 companies. They were all guaranteed to contain the required amounts of plant food and of this number 180, or 11.1 per cent., failed to meet their guarantees in one or more forms of plant food, 55, or 3.4 per cent., being deficient in nitrogen, 14, or .9 per cent., being deficient in available phosphoric acid and 126, or 7.8 per cent., deficient in water soluble potash. They had an average composition of 2.18 per cent. nitrogen, 10.57 per cent. available phosphoric acid, .62 per cent. insoluble phosphoric acid and 5.75 per cent. water soluble potash. The average retail selling value was estimated as \$33.36 a ton. Of the total number of samples nearly all of them, or 1,562, supplied potash in the muriate form, 23 as sulphate of potash and 35 as both muriate and sulphate of potash. The number of Fertilizers having the word "tobacco" as a part of the brand name included 8 samples in which the potash was supplied in the form of sulphate of potash. There were 94 different formula grades included, varying from 1-8-5 to 12-14-6, supplying from 1 to 12 per cent. of nitrogen as ammonia, from 6 to 27 per cent. of available phosphoric acid and from 1 to 20 per cent. of water soluble potash. There were 21 of these formula grades of Complete Fertilizers represented by 10 or more samples and judging from the larger proportion of brands of these grades found being offered for sale a comparison of the grades with the average selling values will be of interest, the number of samples, formula grade and average retail selling price being as follows: 209 of 1-9-4, \$26.77; 262 of 2-8-5, \$29.24; 196 of 2-8-10, \$33.58; 87 of 2-9-3, \$28.91; 20 of 2-10-6, \$31.12; 82 of 2-12-2, \$29.29; 110 of 2-12-4, \$31.51; 10 of 2-12-5, \$30.70; 26 of 2-12-6, \$32.88; 35 of 2-16-8, \$39.82; 40 of 3-10-6, \$37.14; 21 of 3-12-5, \$33.71; 19 of 4-8-4, \$37.55; 29 of 4-8-6, \$36.53; 107 of 4-8-7, \$38.28; 41 of 4-12-4, \$43.28; 45 of 4-16-4, \$43.40; 21 of 4-16-10, \$50.04; 26 of 5-8-5, \$41.84; 12 of 5-8-7, \$43.56; and 13 of 5-10-5, \$38.96.

Ground Bone Fertilizers. The Ground Bone class of Fertilizers supplying nitrogen and total phosphoric acid included 73 samples and 37 brands registered by 28 companies. They were found upon analysis to have an average composition of 3.29 per cent. nitrogen, 24.07 per cent. total phosphoric acid and selling at an average of \$52.47. Eleven, or 15.1 per cent., of the samples failed to meet their guarantees, 5, or 6.9 per cent., of the samples being deficient in nitrogen and 6, or 8.2 per cent., were deficient in total phosphoric acid.

Superphosphate Fertilizers. There were 369 samples of this class of materials supplying phosphoric acid in an available form, registered by 56 companies, and of this number 335 samples and 76 brands represented Superphosphate Fertilizers, formerly classified as Acid Phosphates, and 34 samples and 12 brands included the so-called Lime Phosphate Fertilizers, prepared for special purposes by addition of lime products to Superphosphates. The Superphosphate Fertilizers of the first group averaged 19.06 per cent. total phosphoric acid, 18.44 per cent. available phosphoric acid and .62 per cent. insoluble phosphoric acid, retailing at an average of \$20.64 a ton. There were 3, or .9 per cent., deficient in available phosphoric acid. The Lime Phosphate Fertilizers averaged 15.69 per cent. total phosphoric acid,

14.33 per cent. available phosphoric acid, 1.36 per cent. insoluble phosphoric acid and retailed at an average of \$20.10 a ton. There were 2, or 5.9 per cent., of the samples deficient in available phosphoric acid.

Rock and Potash Fertilizers. There were 167 samples of this class of Fertilizers supplying available phosphoric acid and water soluble potash, representing 57 brands, registered by 41 companies, which were found upon analysis to have an average composition of 12.44 per cent. available phosphoric acid and 5.77 per cent. water soluble potash, and retailing at an average of \$26.20 a ton. They were all guaranteed to contain 14 per cent. or more total units of plant food, as is required in the case of Mixed Fertilizers, and of the total number of samples 27, or 16.2 per cent., failed to correspond with guarantees claimed, 2, or 1.2 per cent., being deficient in available phosphoric acid and 25, or 15 per cent., being deficient in water soluble potash. Of the 167 samples of this class all contained potash as muriate of potash except 3, which contained both sulphate and muriate of potash.

Miscellaneous Fertilizers. The official samples classified as miscellaneous materials numbered 130 and included 69 brands, registered by 30 companies. The following number of samples with their average compositions and retail selling values were as follows: 56 of Nitrate of Soda, averaging 15.66 per cent. nitrogen and \$63.79 a ton; 19 of Sulphate of Ammonia, averaging 20.87 per cent. nitrogen and \$65.98 a ton; one of Dried Blood, containing 11.89 per cent. nitrogen and reported as retailing at \$102.50 a ton; 10 of Tankage, averaging 6.45 per cent. nitrogen, 11.06 per cent. total phosphoric acid and retailing at \$52.25 a ton; 2 of Kainit, averaging 14.93 per cent. potash and \$22.25 a ton; one of Manure Salt, containing 23.82 per cent. potash and retailing at \$24.00 a ton; 38 of Muriate of Potash, averaging 50.74 per cent. potash and \$52.06 a ton; one of Sulphate of Potash, supplying 50.88 per cent. potash and retailing at \$62.85 a ton, and 2 Miscellaneous Materials, supplying nitrogen and phosphoric acid. Of this class of Fertilizers 12, or 9.2 per cent., failed to meet their guarantees, 2 of these being Nitrate of Soda, one Dried Blood, 2 of Tankage, 6 Muriate of Potash and one Miscellaneous.

In the following pages will be found Acknowledgments; Table I, showing Number of Deficiencies in Each Class; Table II, Average Analyses and Retail Prices; Key to Tables, explaining the large Tables which follow, showing in detail results of chemical analyses of each official sample received from the agents, together with brand names, names of manufacturers and selling agents, guarantees for the several forms of plant food which they contain and retail selling prices; Table III, Complete Fertilizers; Table IV, Ground Bone Fertilizers, Table V, Superphosphate Fertilizers; Table VI, Rock and Potash Fertilizers, and Table VII, Miscellaneous Fertilizers.

Acknowledgments

Mr. V. B. Hausknecht, First Assistant Chemist, in charge of the Chemical Laboratory, had immediate supervision of the reception and analyses of the official samples, the approval of applications for regis-

tration, the issuing of licenses and the preparation of the Tables included in this Report. The microscopical examinations were made by H. E. Gensler, Assistant Chemist and Micro-Analyst, and the following Assistant Chemists performed the chemical analyses: G. J. Kuhlman, Jr., F. B. Williams, Harold Y. Fisher, Joseph F. Bradley and Mooredean Plough. The samples were prepared for analysis by Myrtle W. Copeland, Laboratory Assistant.

KEY TO TABLES

The following tables include the detailed results of chemical analyses of each sample. All samples were given a chemist's number as shown in the extreme left and right hand columns and are grouped in alphabetical order of manufacturers and brand names. Each class is shown in separate tables and the following information will serve as a key to these tables:

The asterisk (*) indicates the cases where total nitrogen, available phosphoric acid and total potash are deficient to the extent of .2 per cent. or more below their respective guarantees. In cases where the guarantees are .5 per cent. or less the deficiencies noted are where the amount is .1 per cent. or more below the guarantees.

Order of results of analysis: Total Nitrogen found and Guaranteed; Total Phosphoric Acid found and guaranteed; Available Phosphoric Acid found and guaranteed; Insoluble Phosphoric Acid found and guaranteed; Total Potash found and guaranteed and Potash as Muriate and as Sulphate.

To determine the formula of any brand, as guaranteed, multiply Total Nitrogen guaranteed by 1.2158 to obtain Ammonia and then use this figure and the guarantees for Available Phosphoric Acid and Total Potash. For example, Nitrogen guarantee equals .82% (.82 x 1.2158=1%). Ammonia equals 1%; Available Phosphoric Acid, 8%, Potash, 5%. Formula therefore is 1-8-5.
